В търсене на състояния със смесена симетрия в ядрото Po-212

Атестационен семинар

Докторант: Диана Кочева

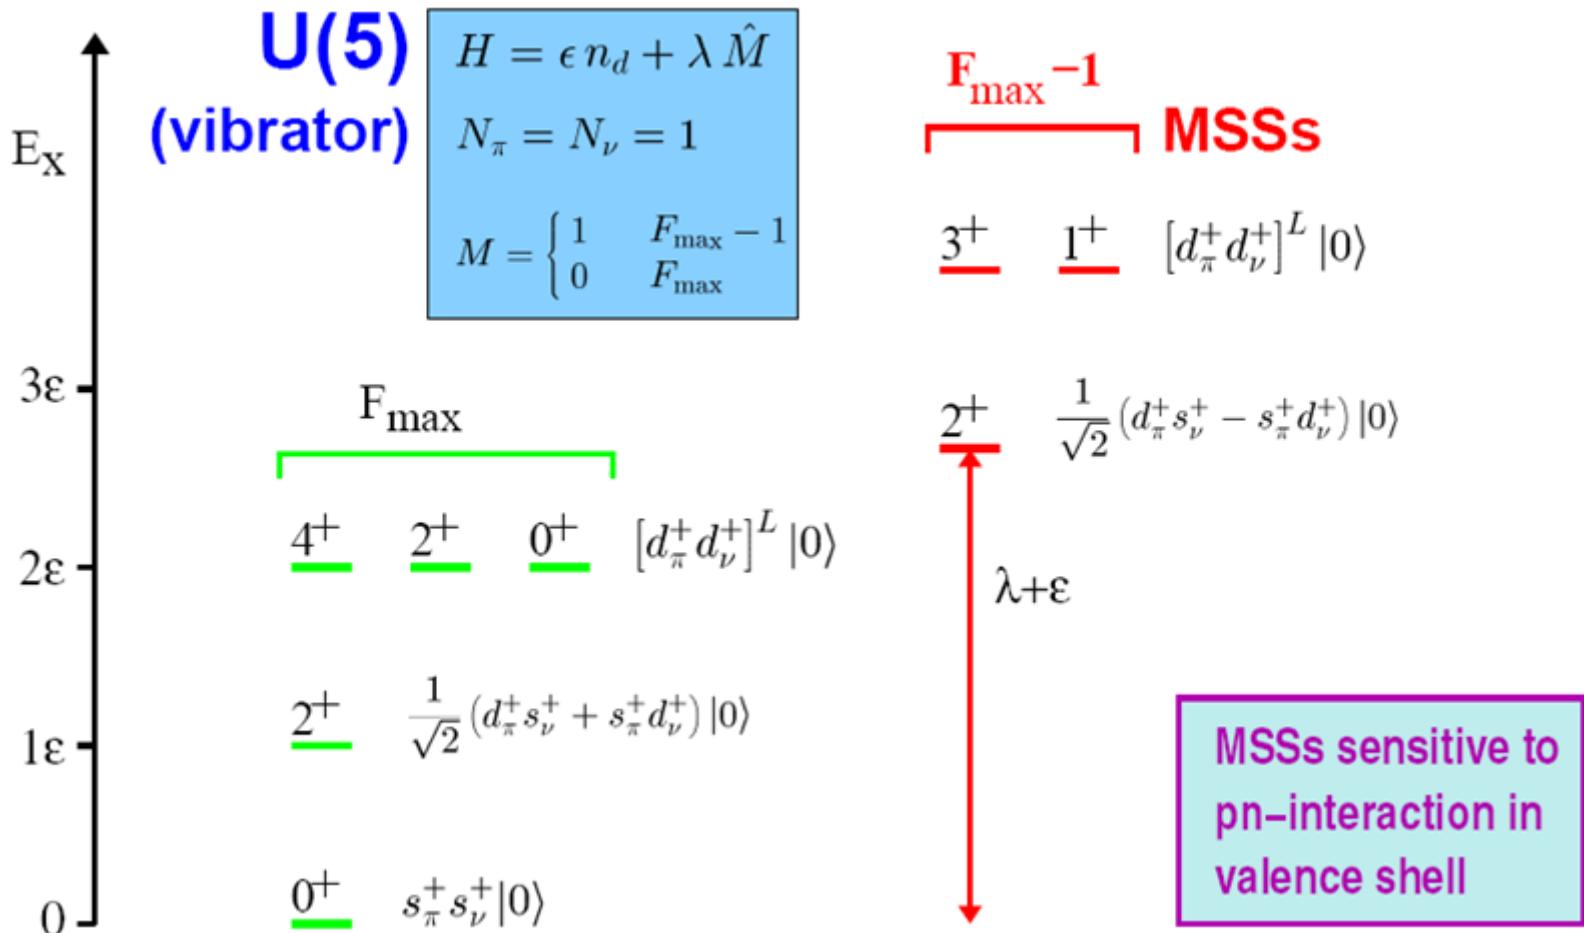

Научен ръководител: Проф. дфzn Г. Райновски

Състояния със смесена симетрия?

Еднофононното $2^+_{1,ms}$ състояние със смесена симетрия е фундаментално

квадруполно-колективно изовекторно възбуждане във валентните слоеве на сферични ядра

Пример: Хармоничен осцилатор, $N=2$

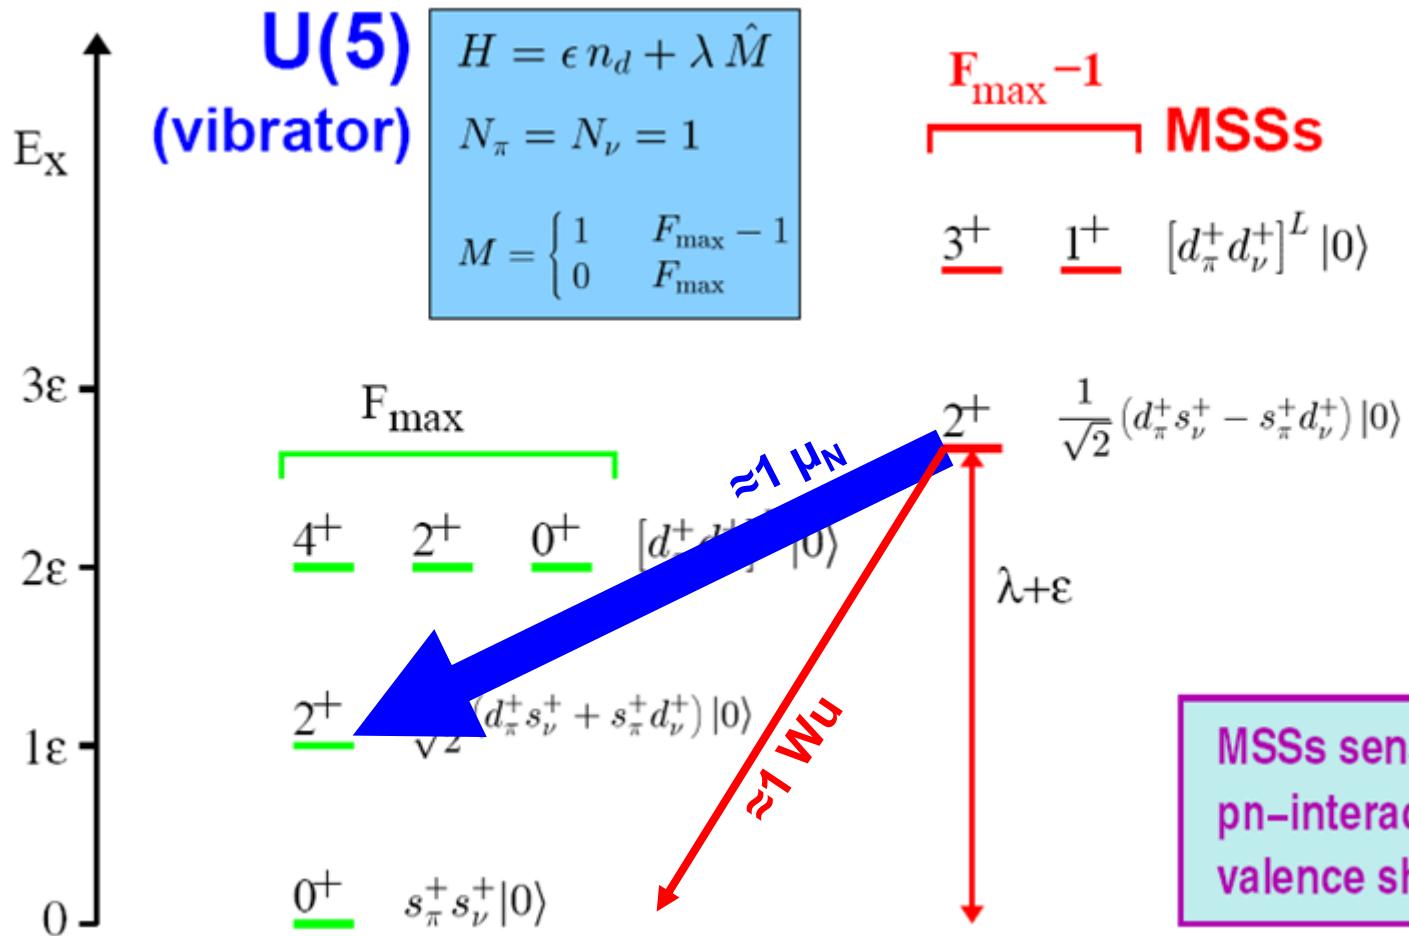

Състояния със смесена симетрия?

Експериментални наблюдаеми, необходими за идентификацията на еднофононно ССС

→ Силен M1-преход

- Спин и четност: 2^+
- Времена на живот: много късоживущи - стотици фемтосекунди;
- Отношения на разклонение на γ -разпад: основен канал към 2^+
- Отношение на мултиполно смесване: $|\delta| < 1$

Експериментални наблюдаеми, необходими за идентификацията на еднофононно ССС

Експериментална част

Тандемен ускорител в Кьолн, Германия

- Реакция – $^{208}\text{Pb}(^{12}\text{C}, ^8\text{Be})^{212}\text{Po}$ @ 62 MeV ($V_{\text{col}} \approx 64$ MeV);
- Мишена – 10 mg/cm² ^{208}Pb (99% обогатена);
- Експериментална установка – „плънджерно устройство“:
 - 5 HpGe детектора на 142.3°, 6 HpGe детектора на 35.0° и 1 HpGe детектор на 0°;
 - пръстен от 6 соларни клетки (10 mm × 10 mm) покриващи ъгъл м/у 116.8° - 167.2°;
 - основен тригер - γ - α или γ - γ съвпадения;

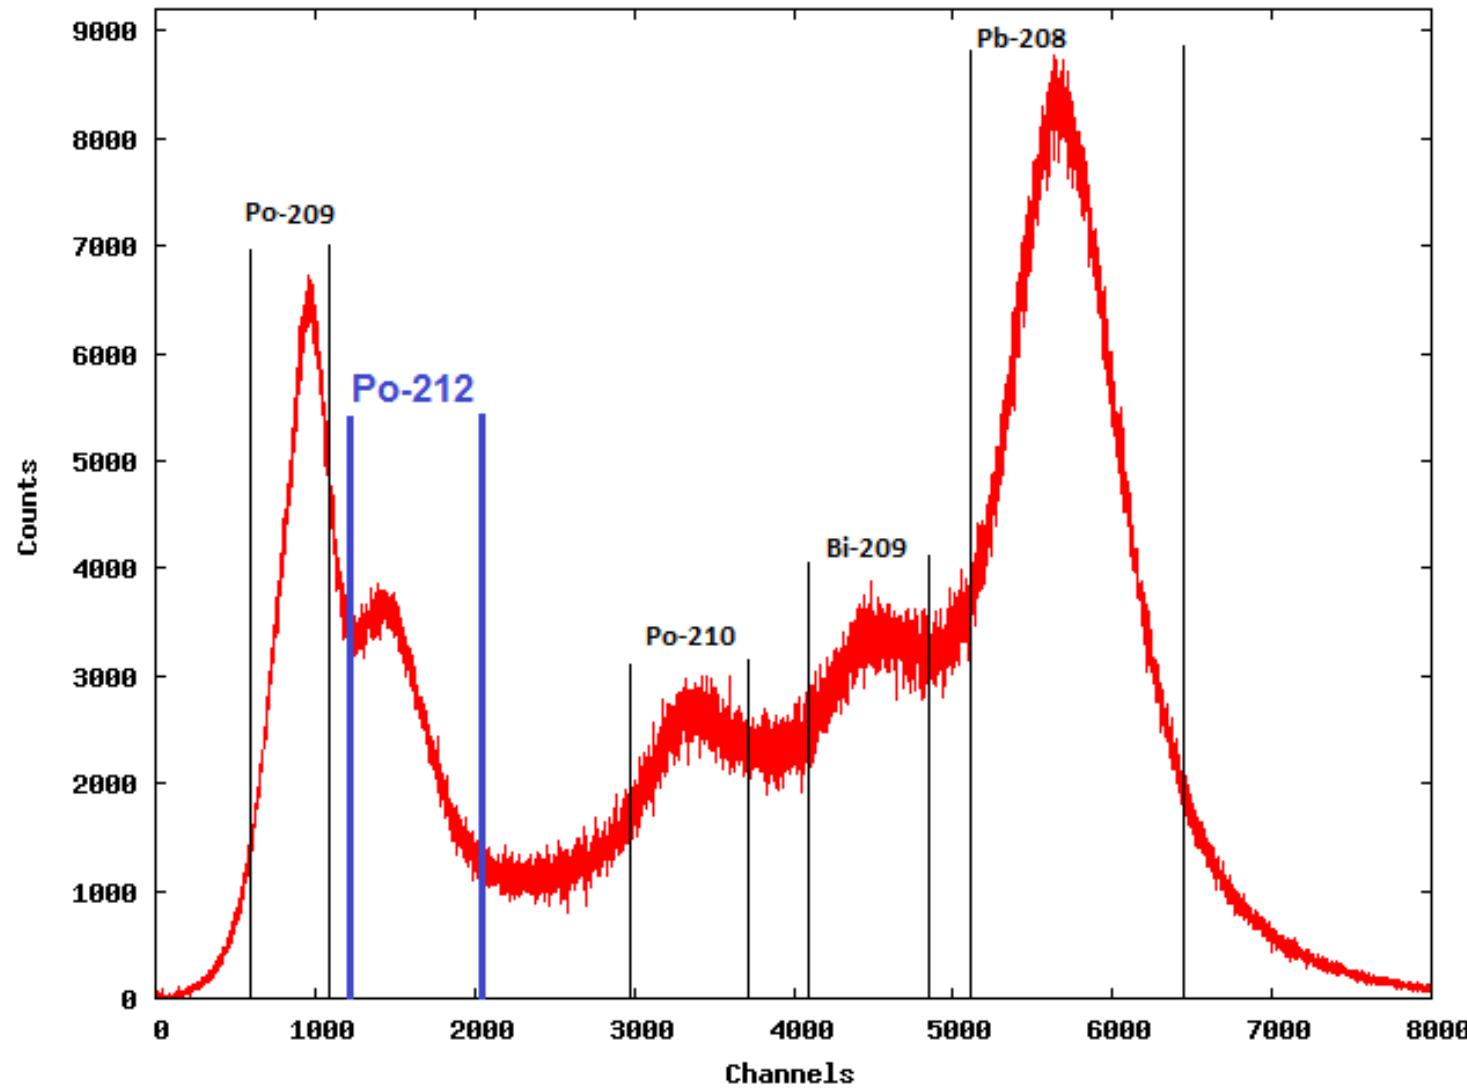

- Кинематика на реакцията

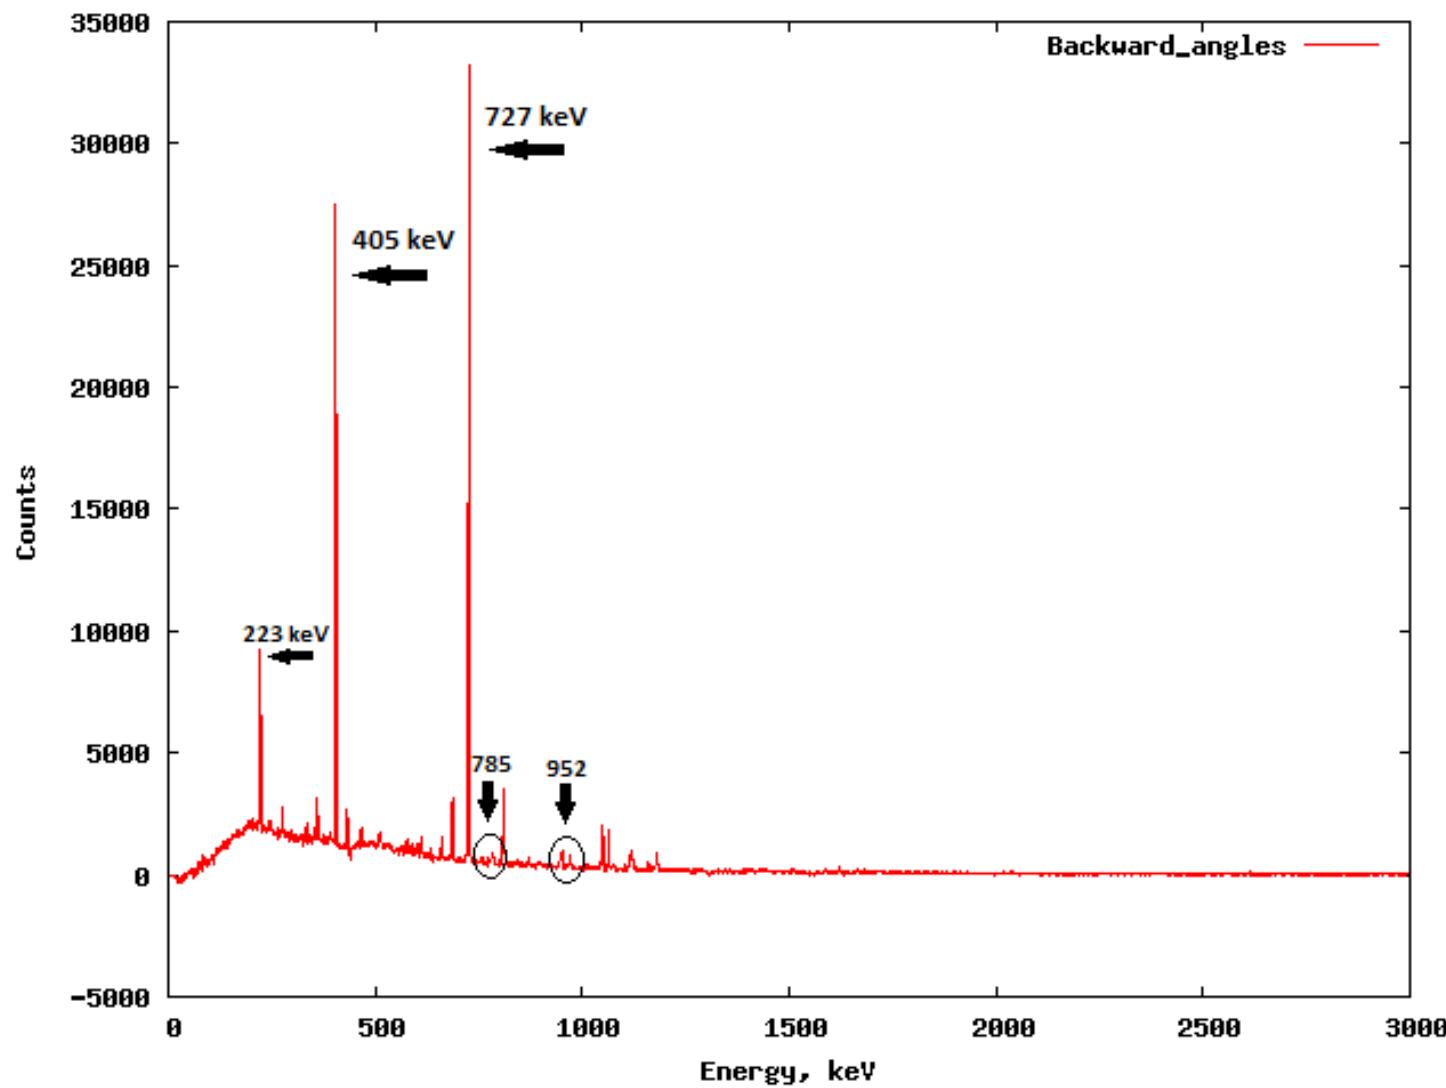

$$\langle v_0(^{212}\text{Po})/c \rangle \approx 0.9$$

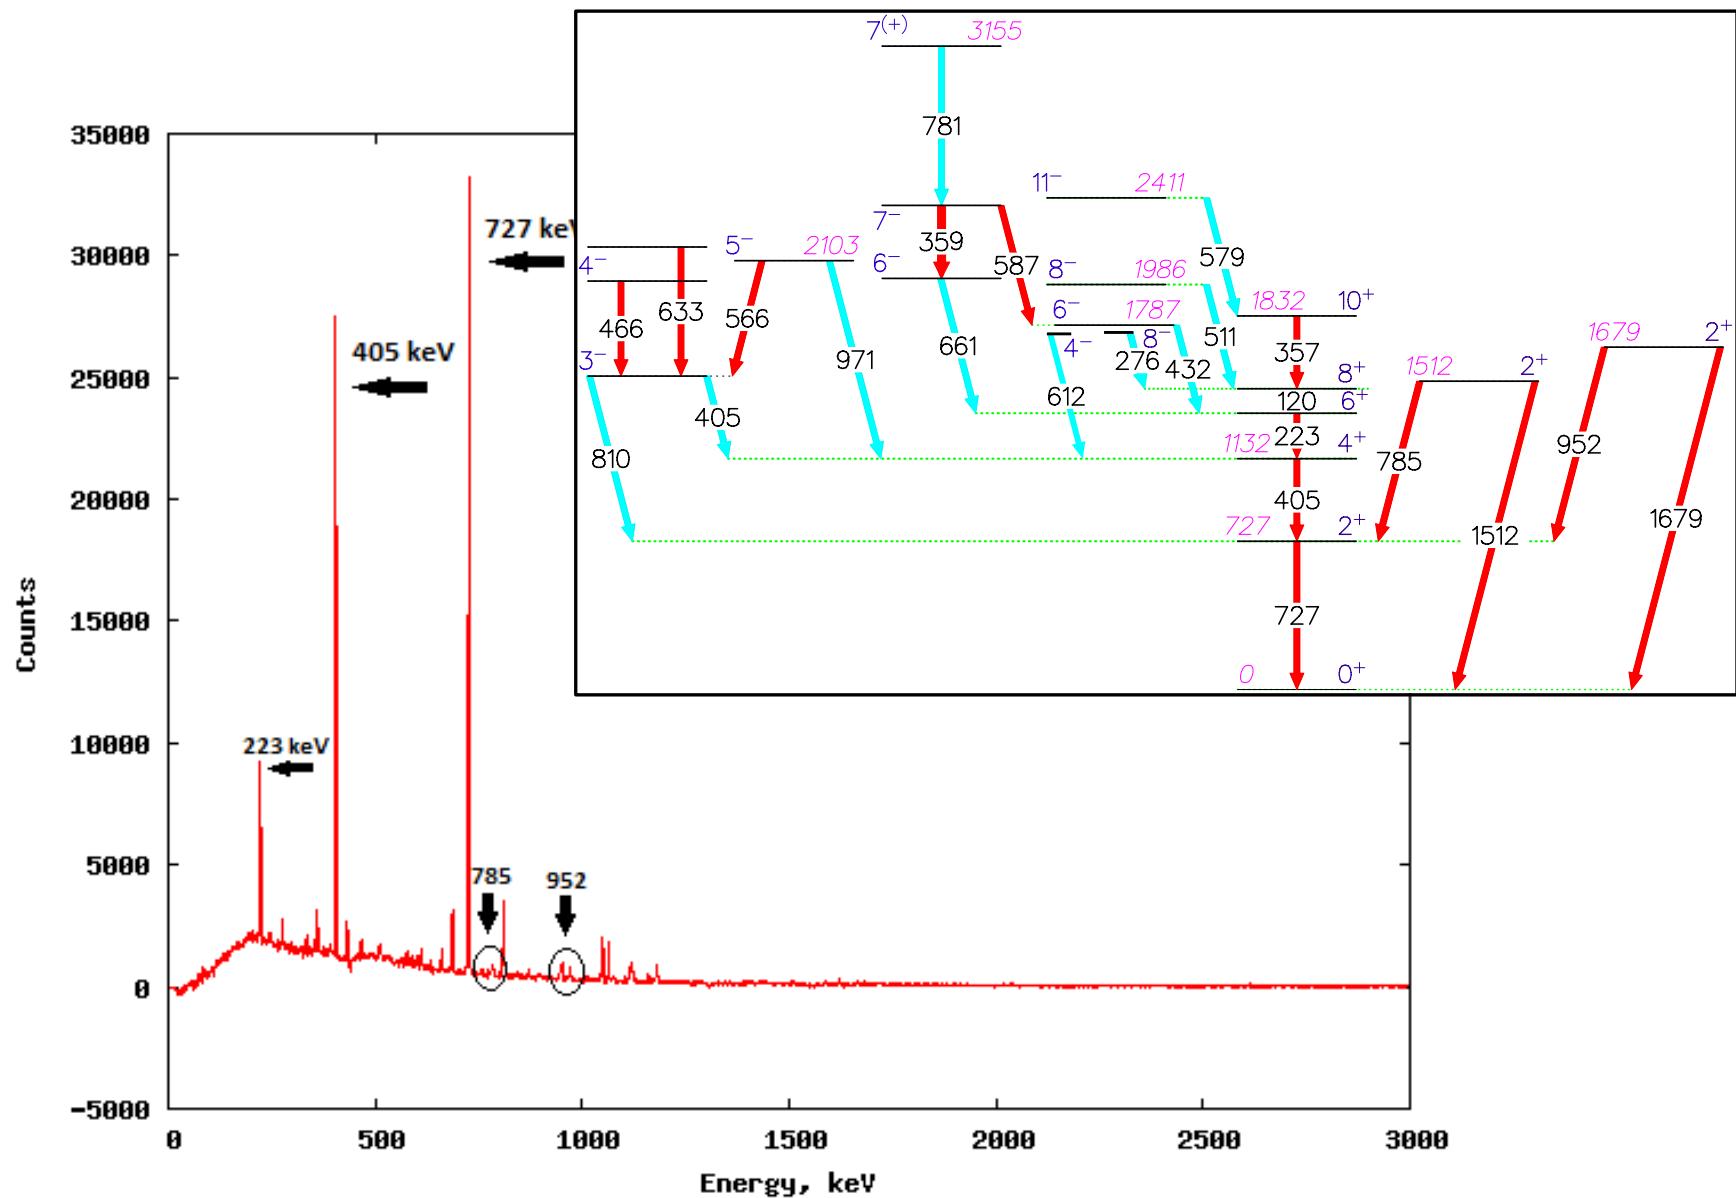

Експериментална част

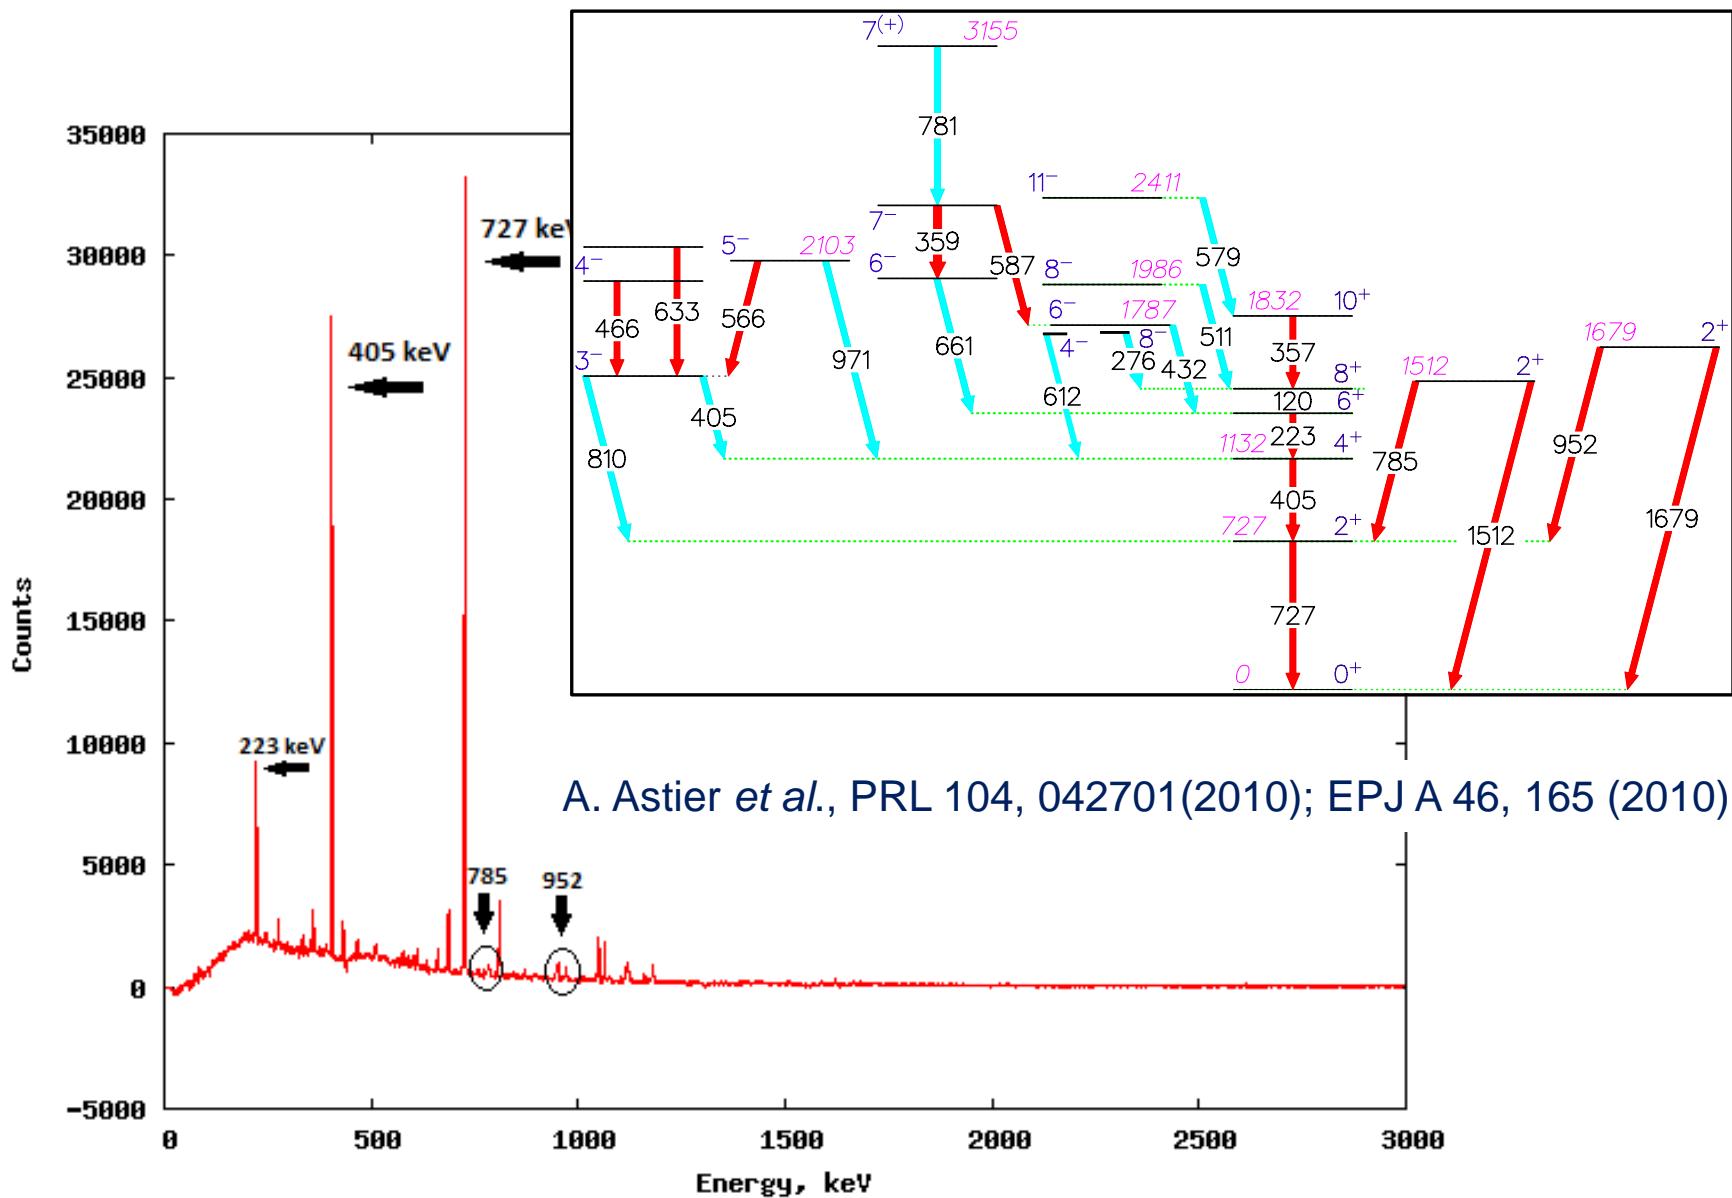

Експериментална част

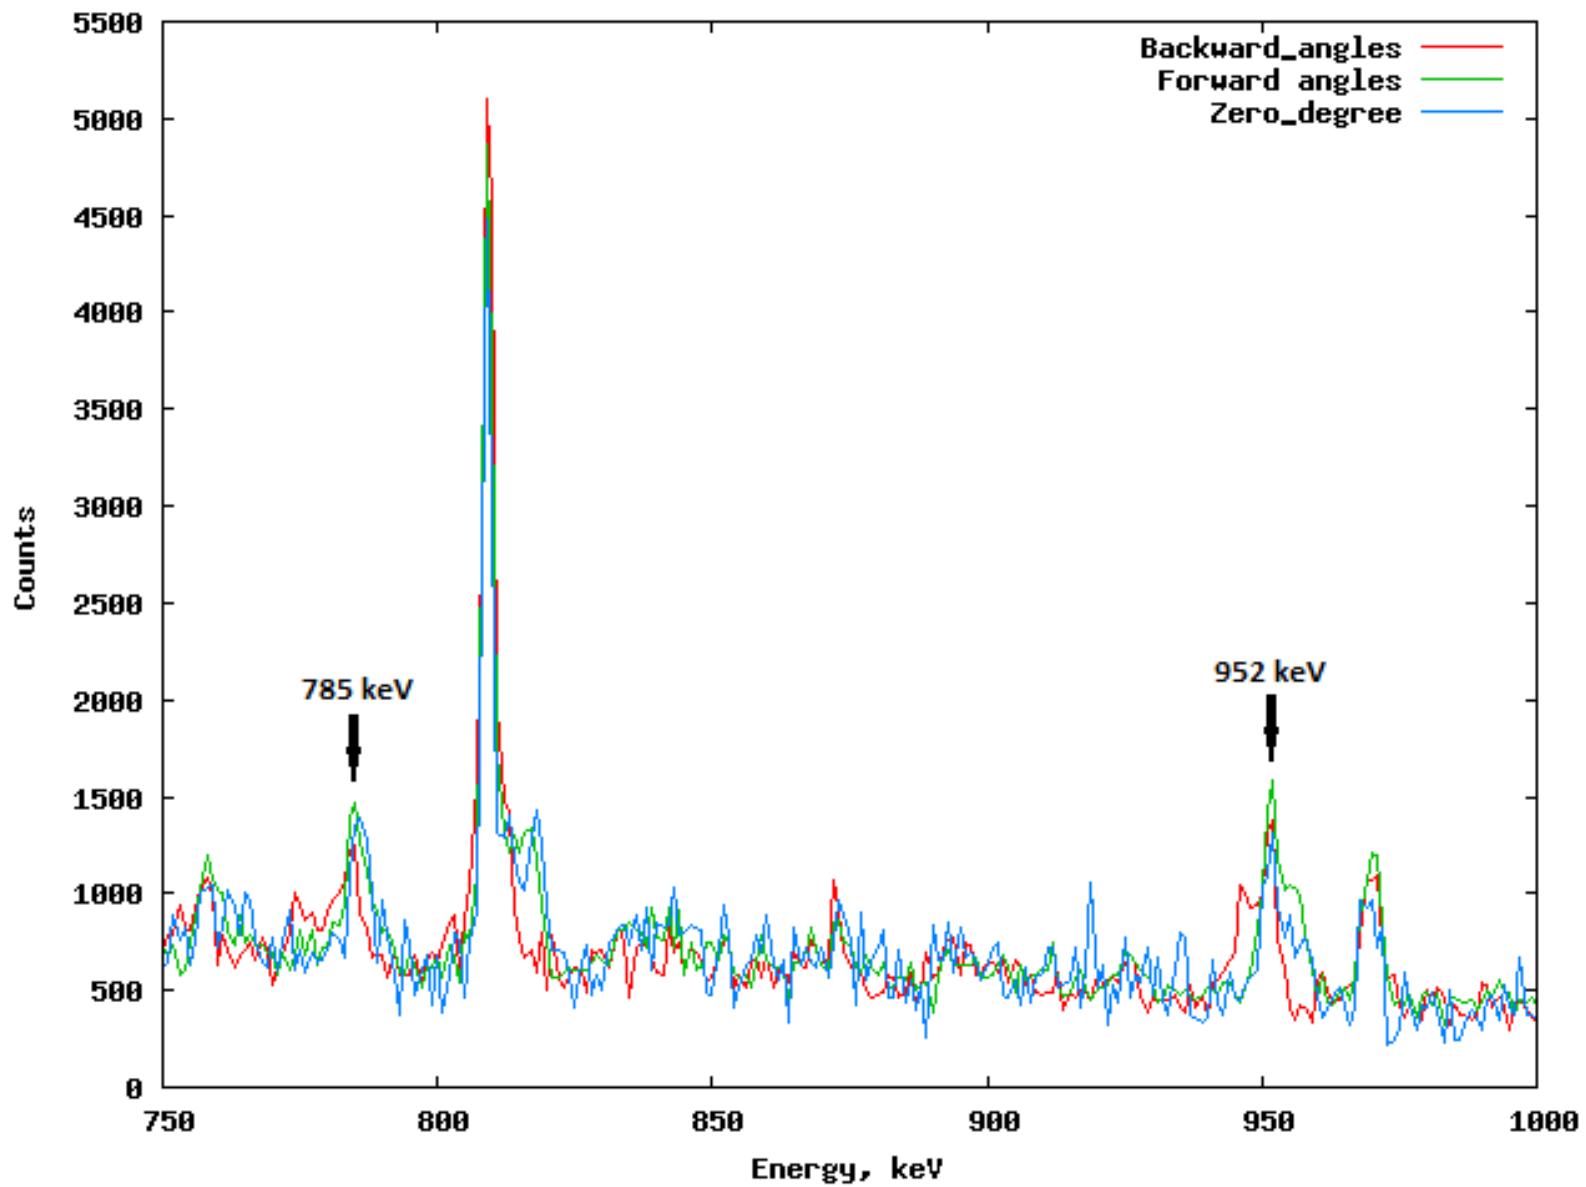

Експериментална част

Експериментална част

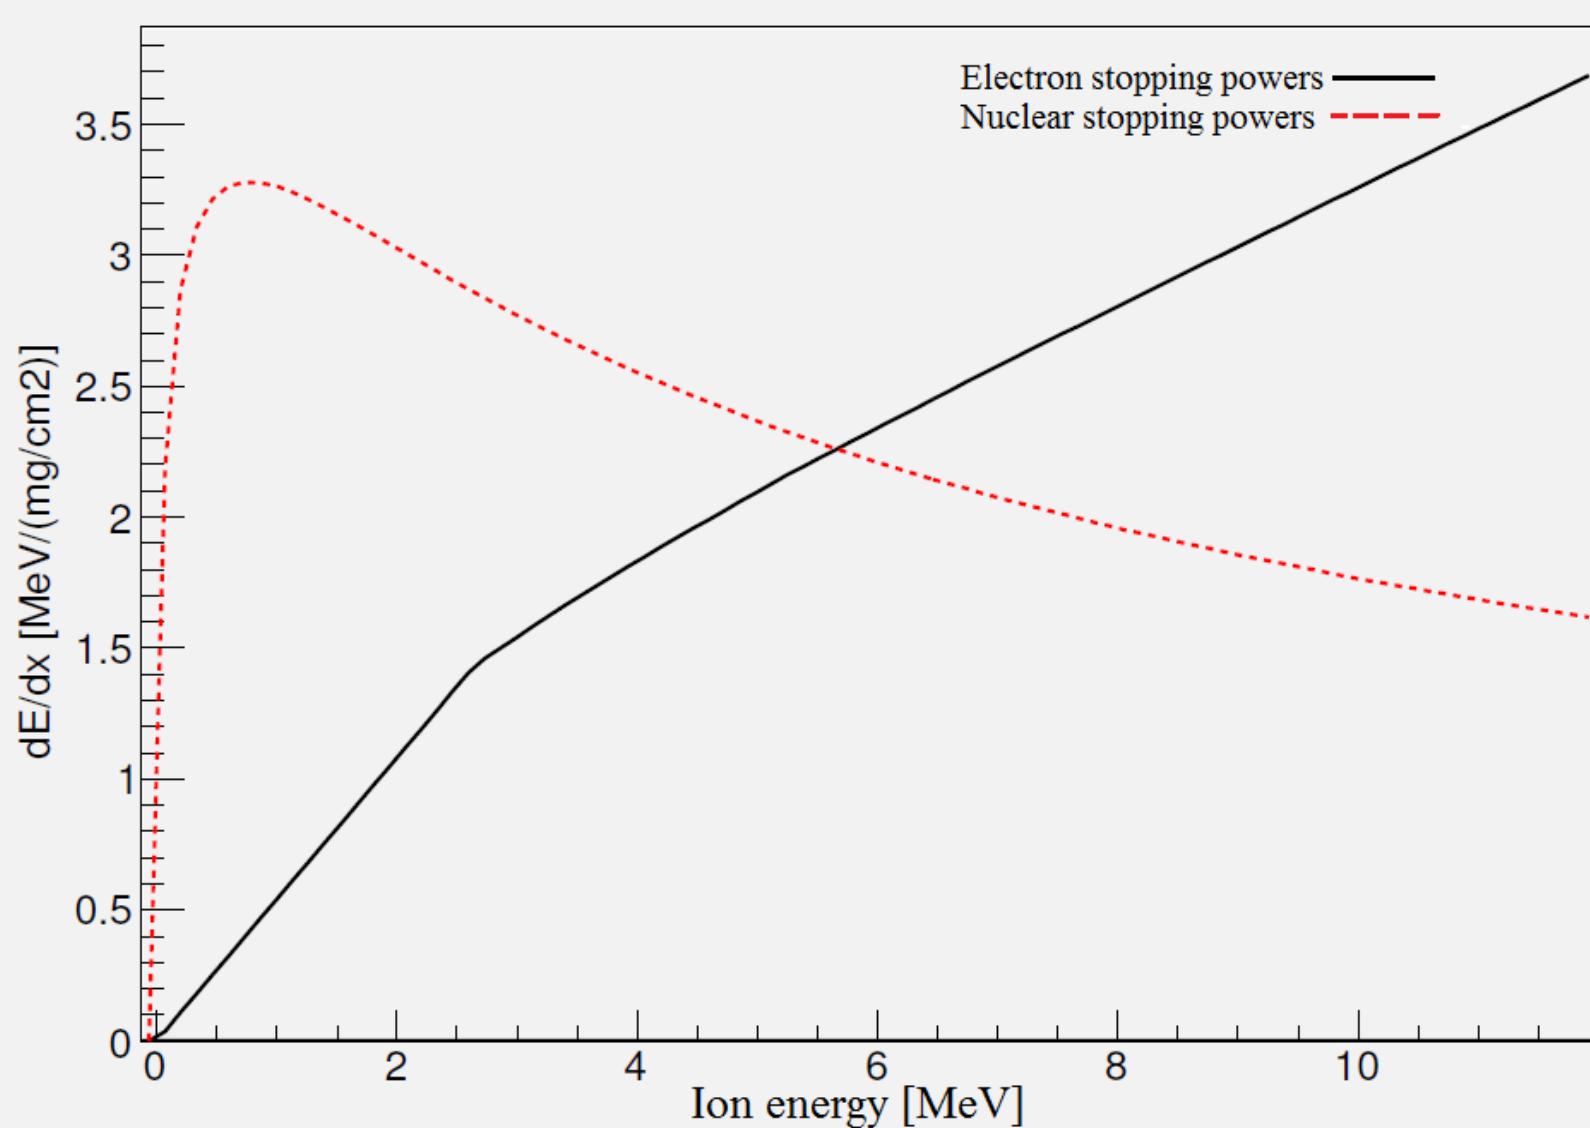

Експериментална част

Експериментална част – line-shape analysis

- 1) Cologne-Sofia DSA analysis (based on P. Petkov et al., NPA 640, 293 (1998); Nucl. Instrum. Methods Phys. Res. A 431, 208 (1999)):
 - The slowing-down process - Monte Carlo simulation based on the **modified DESASTOP**
 - Electronic stopping (continuous process) – electronic stopping powers from modified **Northcliffe&Schilling tables**;
 - Nuclear stopping (discrete process) – **complete Monte-Carlo approach** with cross sections based on the formalism of **Lindhard, Scharff, Schiøtt** reduced by 30%;
- 2) Analysis Program for Continuous Angle DSAM – APCAD (C. Stahl, thesis, TU Darmstadt 2015):
 - The slowing-down process - Monte Carlo simulation based on **GEANT4**:
 - Electronic stopping (continuous process) – **modified Northcliffe&Schilling tables**;
 - Nuclear stopping (hybrid treatment) – **Monte-Carlo approach for angular straggling + continuous energy loss** where nuclear stopping powers are taken with **40% reduction from SRIM 2013** (J.F. Ziegler, M.D. Ziegler, J.P. Biersack, Nucl. Instr Meth., B268, 1823 (2010));

Stopping Powers for Po-212 in Pb-208

Експериментална част – line-shape analysis

Ниско спинови състояния с положителна четност в ядрото на Po-212

Single-shell approximation + empirical interaction from neighboring nuclei (P. Van Isacker)

$$^{212}\text{Po} : {}^{208}\text{Pb} + \nu(2g_{9/2})^2 + \pi(1h_{9/2})^2$$

Basis states: $| (2g_{9/2})^2 J_\nu, (1h_{9/2})^2 J_\pi; J \rangle \equiv | J_\nu J_\pi J \rangle$

$$\langle J_\nu J_\pi J | \hat{H} | J'_\nu J'_\pi J \rangle = (V_{\nu\nu}^{J_\nu} + V_{\pi\pi}^{J_\pi}) \delta_{J_\nu J'_\nu} \delta_{J_\pi J'_\pi} + 4\sqrt{(2J_\nu+1)(2J_\pi+1)(2J'_\nu+1)(2J'_\pi+1)} \sum_R \begin{bmatrix} j_\nu & j_\pi & J_\pi & J_\nu \\ R & j_\pi & J & j_\nu \\ j_\nu & j_\pi & J'_\pi & J'_\nu \end{bmatrix} V_{\nu\pi}^R$$

$V_{\nu\nu}^{J_\nu}$: from the experimental spectrum ($0^+ - 8^+$) of ${}^{210}\text{Pb}$ (2 ν in $2g_{9/2}$)
 $V_{\pi\pi}^{J_\pi}$: from the experimental spectrum ($0^+ - 8^+$) of ${}^{210}\text{Po}$ (2 π in $1h_{9/2}$) } seniority spectra

$V_{\nu\pi}^R$: from the experimental spectrum ($0^- - 9^-$) of ${}^{210}\text{Bi}$

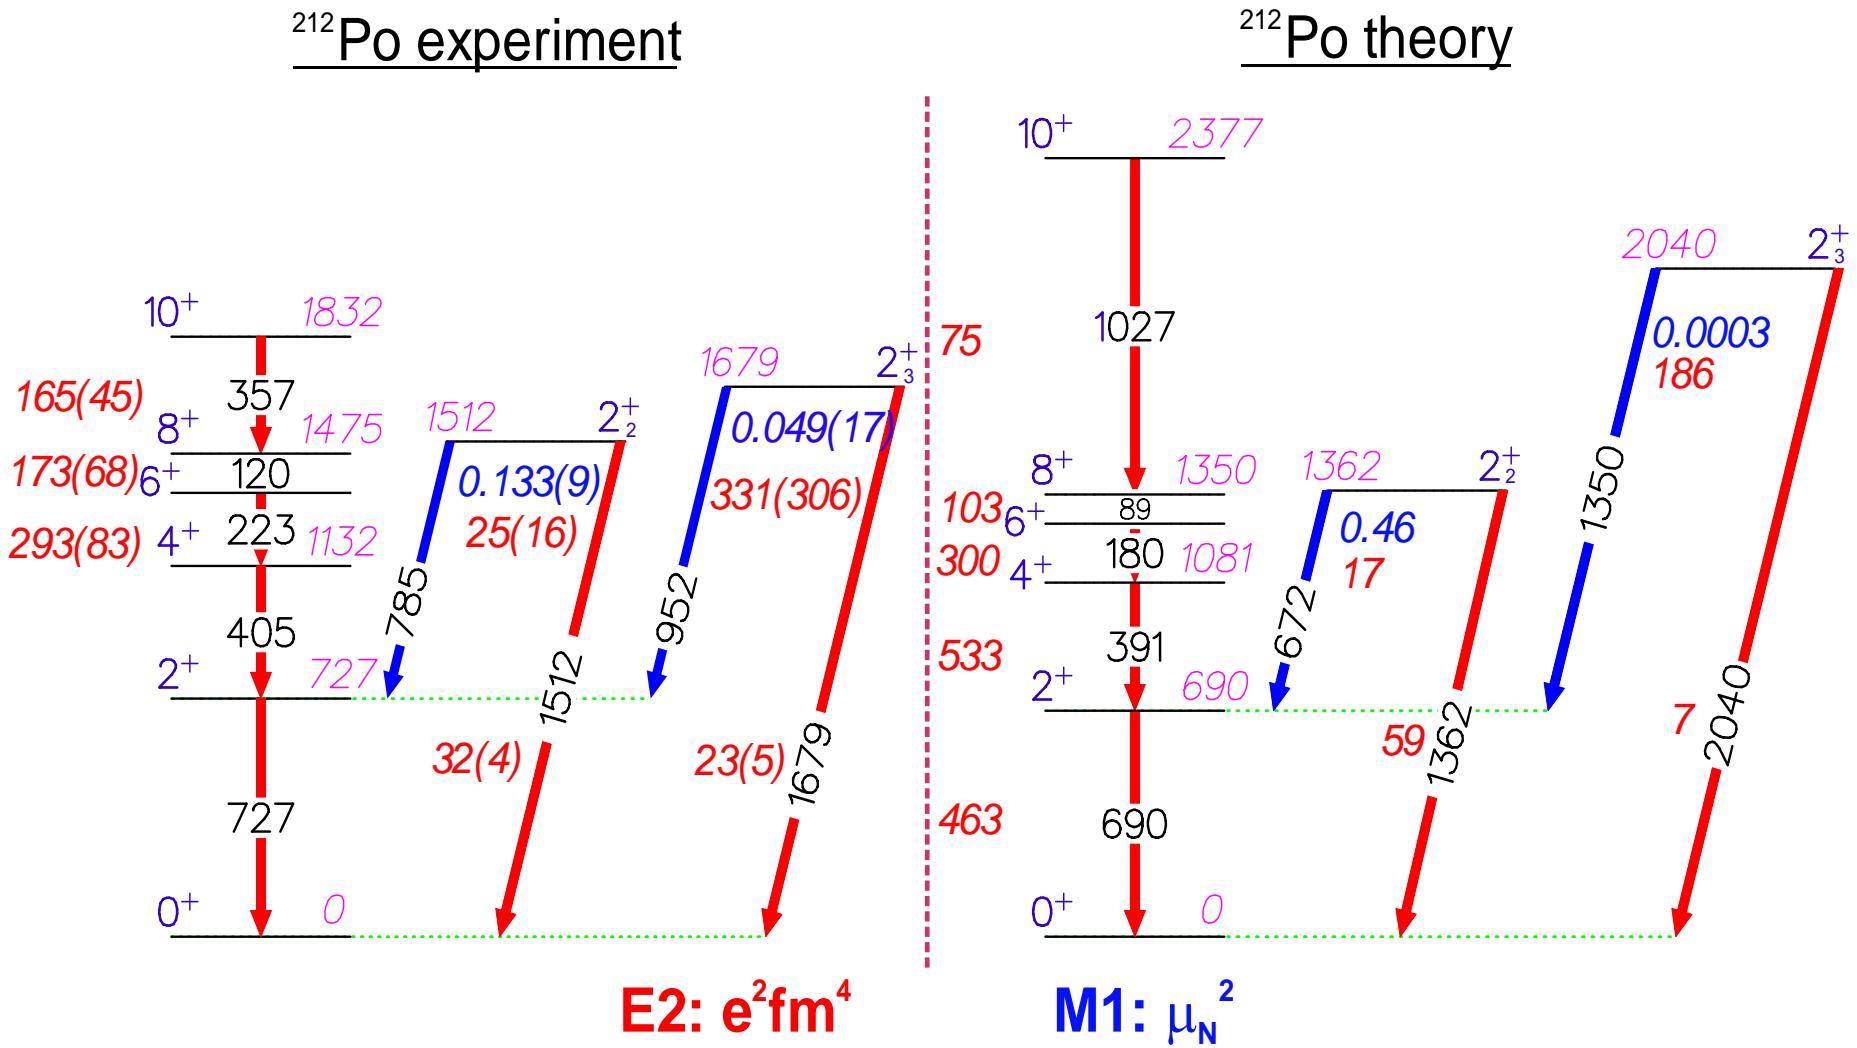

M1 operator: $\hat{T}_\mu(M1) = \sqrt{\frac{3}{4\pi}} \sqrt{\frac{j(j+1)(2j+1)}{3}} [g_\nu (\nu_j^\dagger \times \tilde{\nu}_j)_\mu^{(1)} + g_\pi (\pi_j^\dagger \times \pi_j)_\mu^{(1)}]$

$$j = j_\nu = j_\pi = 9/2 \quad g_\nu = -0.33\mu_N \quad g_\pi = +0.91\mu_N \quad \left[\begin{array}{l} {}^{209}\text{Pb} : \mu(9/2_{1,\text{gs}}^+) = -1.4735(16)\mu_N \\ {}^{209}\text{Bi} : \mu(9/2^-, 1, \text{gs}) = +4.1103(5)\mu_N \end{array} \right]$$

E2 operator: $\hat{T}_\mu(E2) = -\sqrt{\frac{(2j-1)(2j+1)(2j+3)}{64\pi j(j+1)}} (N + \frac{3}{2}) b^2 [e_\nu (\nu_j^\dagger \times \tilde{\nu}_j)_\mu^{(2)} + e_\pi (\pi_j^\dagger \times \pi_j)_\mu^{(2)}]$

$$b \approx 1.0A^{1/6} fm \quad e_\nu = 0.88 \quad e_\pi = 1.11 \quad \left[\begin{array}{l} B(E2; 8^+ \rightarrow 6^+) \quad \text{in } {}^{210}\text{Pb and } {}^{210}\text{Po} \end{array} \right]$$

Ниско спинови състояния с положителна четност в ядрото на Po-212

Изовекторно състояние в ^{212}Po

$$|2_1^+\rangle = 0.488 |J_\nu = 0, J_\pi = 2, J = 2\rangle \quad (+) \quad 0.819 |J_\nu = 2, J_\pi = 0, J = 2\rangle + \dots \quad 87\%$$
$$|2_2^+\rangle = 0.813 |J_\nu = 0, J_\pi = 2, J = 2\rangle \quad (-) \quad 0.517 |J_\nu = 2, J_\pi = 0, J = 2\rangle + \dots \quad 93\%$$

- Почти ортогонални състояния;
- Състои се от протонни и неутронни S ($J_{v(\pi)}=0$) и D ($J_{v(\pi)}=2$) двойки;
- 2_2^+ състояние има изовекторна природа;

Идентифицирано беше първото ниско лежащо изовекторно състояние в областта около двойномагичното ядро Pb-208 .

Благодаря за вниманието!
